BENCINI
CUBOLAMP UNIVERSAL
(FlashCube Adapter)

Characteristics and functions

As soon as the revolutionary flash system called "FlashCube" was presented, Bencini created a plastic flashing light, or rather a cube holder, which could be housed on the normal flash camera slides. There are two versions of this accessory: the one called "Universal" which has the connection cable to the camera's flash-socket and the version called "Special" which has no cable, but has the contact to connect it directly to the hot contact of the slide. With this solution you had 4 flashes at once ... You just had to remember to manually turn the cube to bring the new bulb into working

position ... For this purpose, the large black striped plastic wheel located under the foot frame was useful.

The version with synchronous cable had two variants. It can be found with the door of the screen-printed battery compartment with the distance scale and the corresponding working diaphragms, or the version with the door designed to hold, well rolled up, the synchro-cable.

The cube holder was sold with a rigid plastic case with automatic closure. Two slots on the back of the case made it possible to put the case itself on the shoulder strap of the camera bags.
The power supply is supplied by two 1.5v AA batteries.
Weight 1.45ozg. (Batteries and cube excluded).
Height 2.76in. Maximum width 1.34in. Depth 2.17in.
