

# LEITZ D.U.-24 A

Leitz Code: 37973

## Characteristics and functions

The remote control for automatic fading with synchronous rendering of sounds and images D.U.-24 A allows fading projections without the annoying "black screen" during the change of the projected slide.

Using the automatic command for fading D.U.-24 A for two projectors you have the possibility of recording on tape to make the projection completely automatic.

Connected to the control unit a couple of projectors equipped with built-in TRIAC, it acts exclusively through the cursor of the remote control D.U.-24 A.

If a recorder with AV head has been previously connected to the D.U.-24 A control unit, what is done with the remote control is recorded on tape (Record) and then used in projection (Play).

The regulator on a flat guide is the remote control that lets you decide the rhythm of the fade: smooth, slow or fast. A stroke end is pressed the micro-switch that will carry out the change-dia.

With the "Line-Up" switch the lamps of both projectors are turned on simultaneously, so that the two images can be perfectly superimposed if they are faded out.
