

MINOLTA LENS / MONOCULAR CONVERTER

Serial Nr. no
Minolta Code: unknown

Caratteristiche e funzioni

This particular accessory allows you to transform Minolta Manualfocus bayonet mount lenses into spotting scopes. Lenses are applied in the same way as on cameras: with clockwise rotation 54 ° until the lock clicks; to remove the lens from the monocular, press the chrome button and rotate the lens counterclockwise. The Monocular Converter has the dioptric correction of the eyepiece for the compensation of ametropias. Once the lens has been applied, it must be focused at infinity, then an object placed in the distance must be observed and the corrector must be rotated clockwise (myopia compensation) or counterclockwise (hyperopia compensation): thus obtaining the best possible sharpness .

Weight 107g. Diameter: 62mm. Height 51mm.
